Dalle

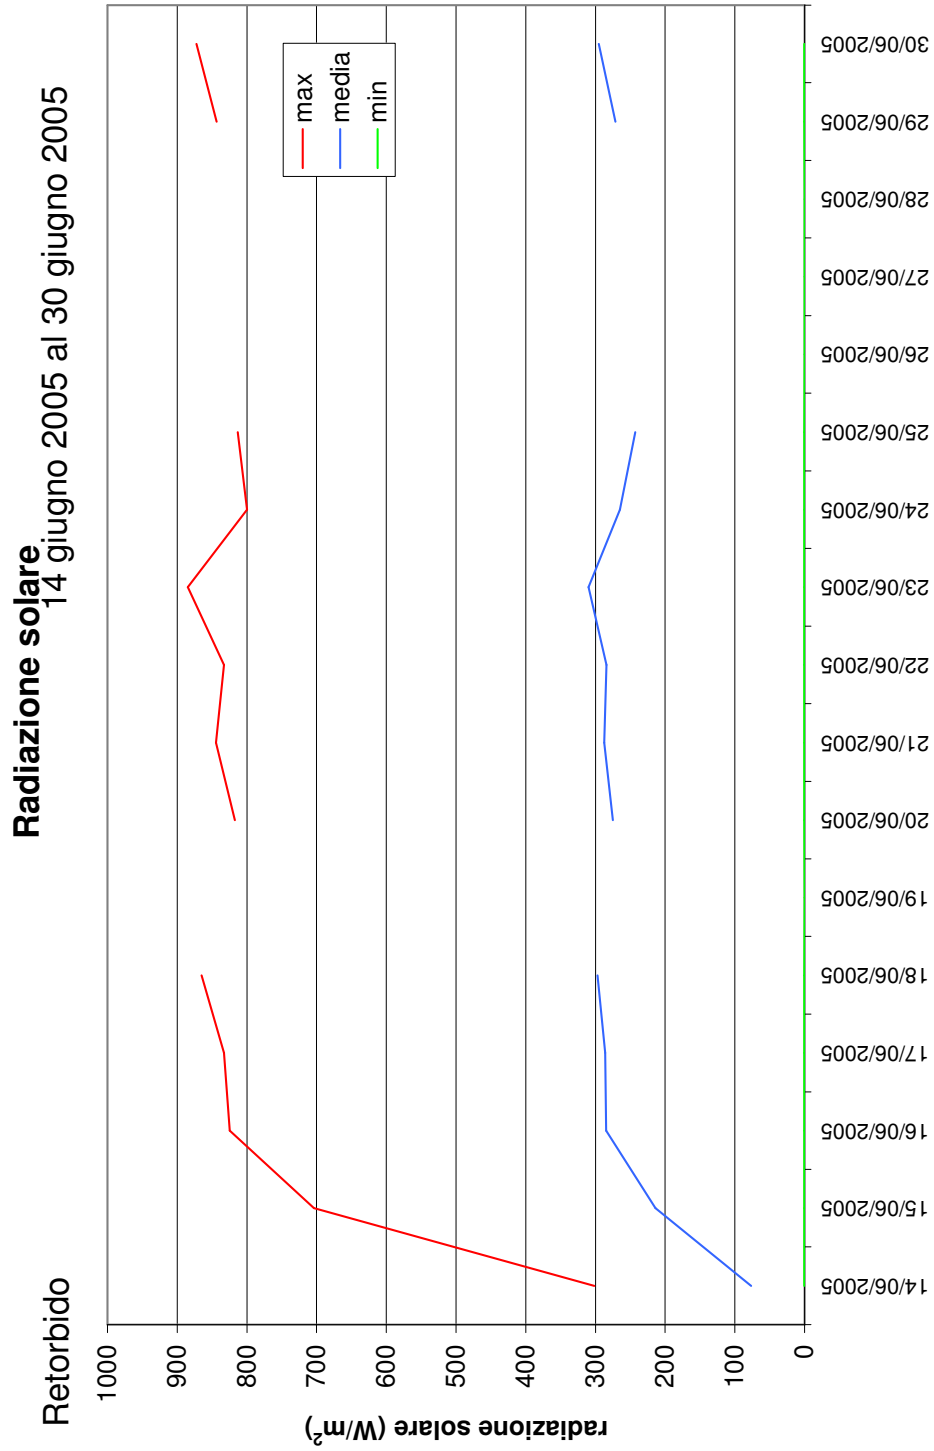

misure effettuate nel Comune di Retorbido nelle due campagne nel periodo da giugno a settembre 2005 emerge che le concentrazioni degli inquinanti misurati in entrambi i siti sono analoghe e anche paragonabili a quelle rilevate presso le centraline della rete di qualità dell'aria di Pavia. E' da rilevare, come si osserva dall'andamento della concentrazione media degli inquinanti in funzione della direzione di provenienza del vento, che gli inquinanti provengono in genere dal quadrante compreso tra il nord e il nord est di Retorbido.

In sintesi la qualità dell'aria del Comune di Retorbido è discreta e i valori sono confrontabili a quelli delle vicine centraline di Voghera.
